Farasa is a **Dependency Parsing** module

Farasa is the state-of-the-art full-stack package to deal with Arabic Language Processing. It has been developed by **Arabic Language Technologies Group** at **Qatar Computing Research Institute (QCRI)** It has a RESTful Web API that you can use through your favorable programming language.

Try Now Use Web API Download Now

Farasa: Arabic NLP

Comprehensive toolkit for Arabic processing:

Word segmentation: wktAbhm → w+ktAb+hm (وكتابهم : و+كتاب+هم)

Lemmatization: ktAb (كتاب)

Part-of-speech tagging: CC+NOUN+PRON

Named entity recognition: PERS, LOC, ORG

Parsing

Diacritic recovery

Spell checking

Farasa is state-of-the-art in all of its components while being blistering fast.

Arabic Diacritization

KAREEM DARWISH

WITH: HAMDY MUBARAK, AHMED ABDELALI

Context and Motivation

Modern Standard Arabic (MSA) text is typically written without diacritics (short vowels) Diacritics are essential for proper disambiguation/pronunciation of words

Ex. علم (Elm) → عَلم (Ealam - flag), عِلْم (Eilom - knowledge), etc.

Diacritic recovery is critical for text-to-speech and pedagogy

Farasa, our diacritizer:

disambiguates **word-cores** (based on context) – ex. عَلم

determines **case-endings** (based on syntactic role) – ex. علمٌ

Core word diacritics

ARABIC DIACRITIZATION

Core Word Diacritics

Core word diacritic recovery requires disambiguation of words in context:

Ex.

*hbt <lY Almdrsp (المدرسة إلى ذهبت) – I went (she went) to *the* school

qAbIt Almdrsp (المدرسة قابلت) – I met *the (female)* teacher

Core Word Diacritics: Training Data

We acquired a diacritized corpus from a commercial vendor:

- contains 9.7 million tokens (194k unique undiacritized tokens)

- composed mostly of MSA (≈ 7 M tokens) and some religious text (≈ 2.7 M tokens)

- covers multiple genres: politics, economics, sports, science, etc.

- has an estimated diacritization errors $< 1\%$

- no omissions of sukun or optional diacritics.

Ask me why we didn't use ATB

Core Word Diacritics: Dictionary

Given every word, we produce multiple representations (ex. وكتابهـم – wakitaAbihimo):

full diacritized surface form (وكتابهـم – wakitaAbihimo)

full diacritized surface form w/o case ending (وكتابهـم – wakitaAbhimo)

diacritized stem w/ and w/o case ending (كتابهـم – kitaAbi and كِتَاب – kitaAb)

diacritized template of full form w/ and w/o case ending (وَفِعَالِهـم – wafiEaAlihimo and وَفِعَالِهـم – wafiEaAlhimo)

diacritized stem template w/ and w/o case ending (فِعَال – fiEaAli and فِعَال – fiEaAl)

We built dictionaries from the different representations and unigram/bigram language models for words and stems

الكلمة	وكتابهـم
مشكلة	وكتابهـم
مشكلة بدون حركة الإعراب	وكتابهـم
الجذع مشكل	كِتَاب
الجذع مشكل دون حركة الإعراب	كِتَاب
التصريف مشكل	وَفِعَالِهـم
التصريف مشكل دون حركة الإعراب	وَفِعَالِهـم
تصريف الجذع مشكل	فِعَال
تصريف الجذع مشكل دون حركة الإعراب	فِعَال

Core Word Diacritics: Disambiguation

Baseline model uses a simple Hidden Markov Model (HMM) with a bigram Language Model:

LM trained on surface form w/o case ending

For a given sentence, we build a lattice of possible diacritized forms

Example: مسح النص (msH AlnS – “deletion of the text” or “he deleted the text”, “the text was deleted”)

مسح (msH) → {مَسَح masoH, مَسَح masaH, مُسِح musiH}

النص (AlnS) → {النَّص Aaln~aS}

Viterbi algorithm picks مَسَح النَّص (masoH Aaln~aS – “deletion of the text”)

Testing was performed on WikiNews test set – 70 articles, 7 genres, 18,300 words, and recent (2013 & 2014)

Core Word Diacritics: Defaults

We constructed a dictionary of function words (ex. كَيْفَ (kyf – how)) and their diacritized forms

Some function words may be confused with other words (ex. عَنْ (Eano – from) and عَنَّ (Ean~a – appeared))

We assume they are function word, because they are far more common

We constructed a dictionary of all words appearing more than 10 times, where one diacritized forms appears more than 90% of the time

Ex. غَزَّة (gaz~apa – Gaza)

غَزَّة usually appears as part of the collocation قِطَاعُ غَزَّة (qTAE gzp – Gaza Strip)

Core Word Diacritics: Back-offs

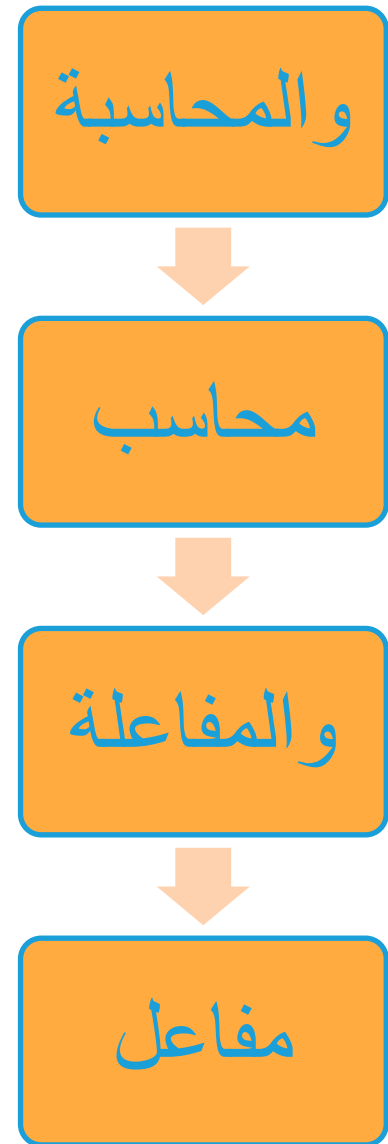

If a word is an OOV, we back-off to:

Stem: we stem the word and use the most likely diacritized form (Farasa Segmenter).

Ex. والمحاسبة (wAlmHAsbp – and the accountant (feminine)) → محاسب (w+Al) (muHAsib)
mHAsb (+ة +p) → مُحَاسِب (muHAsib)

Template: we get the template of the word and use the most likely diacritized form. If that fails, we back-off to stem template, and use the most likely one.

Ex. والمحاسبة (wAlmHAsbp) → (wAlmfAEIp → waAalomufaAEilap & mfAEI → mufaAEil)

Core Word Diacritics: Transliteration

We used Transliteration Mining (TM) to learn diacritized forms of Arabic words (typically named entities) from English transliterations

Given a diacritized Arabic \leftrightarrow English transliteration pair, we obtain TM alignments:

Ex. حسن (Hsn) \leftrightarrow Hassan \rightarrow {ح (Ha) \leftrightarrow Ha, س (sa) \leftrightarrow ssa, ن (no) \leftrightarrow n}

Train a Conditional Random Fields (CRF) sequence labeling model to learn diacritics from the Arabic-English-diacritic tuple {ح-Ha-a, س-ssa-a, ن-n-o}

Mohamed	محمد
Mo	م
Ha	ح
Me	م
D	د

Muhammad	محمد
Mu	م
Ha	ح
Mma	م
D	د

Core Word Diacritics: Transliteration

We trained using 3,452 diacritized Arabic ↔ English diacritized pairs

We extracted transliteration pairs from cross-lingual Wikipedia titles → 125k pairs

We applied the CRF model, leading to the diacritization of 68k Arabic words

Diacritization accuracy is 79%.

Core Word Diacritics: Results

System	% WER	% DER
Baseline	6.64	2.40
Defaults	4.54	1.75
Stem Back-off	4.69	1.44
Template Back-off	5.96	1.90
Transliteration Back-off	6.56	2.39
All Back-offs	4.51	1.35
Defaults+Back-offs	3.29	1.06
MADAMIRA	6.73	1.91
<i>Rashwan et al. (2015)</i>	<i>3.04</i>	<i>0.95</i>
Belinkov and Glass (2015)	14.87	3.89

Case Endings

ARABIC DIACRITIZATION

Case Endings: Parsing

Parsing (إعراب) is slow and SOTA Arabic parser (Farasa) has an accuracy of 89%.

Case Endings: Classical ML (SVM^{Rank})

We framed case ending recovery as a ranking problem

Given possible case endings for a word, rank them using SVM^{Rank}

We used many features such as:

- current word and stem

- current POS tag, gender, and number (Farasa POS tagger)

- previous and next words, stems, and POS tags

- current word prefix(es) and suffix(es)

- current word and stem template

- complex features such as word bigrams and POS trigrams

Accounting for all features is HARD

Word	وكتابهم
Stem	كتاب
POS	cc+noun+pron
Gender	Masculine
Number	Single
Prefix	و+
Suffix	هم+
Template	وفعالهم، فعال

Case Endings: Heuristics

We used some heuristics to restrict the case endings that is SVM^{Rank} would rank, such as:

- If a word or POS appear more than 1,000 and 50 times respectively, restrict case endings to those seen in training

- If POS is a VERB, restrict to {a, o, u, ~a, ~u, or null} and to {a, o, ~a, or null} if not present tense.

- Restrict case endings for some suffixes (ex. “wn” → {a}).

- If stem POS is NOUN and more than 80% of time the case ending was “o” in the training or was diacritized using TM, then restrict to {o} – typically a named entity.

- Plus many more ...

Case Ending: Classical ML Results

System	% WER	% DER
SVM ^{Rank}	13.38	3.98
<i>SVM^{Rank} + Heuristics</i>	<i>12.76</i>	<i>3.54</i>
MADAMIRA	19.02	5.42
Rashwan et al. (2015)	15.95	4.29
Belinkov and Glass (2015)	30.50	7.89

Case Endings: Recurrent Neural Networks

RNN's account for ALL combinations of features

RNN's can look at context

ال+دراس+ة drAs+p	خلال KlAl	ال+باحث+ة bAHv+p	و+رصد+ت rSd	Word Stem
ال_التعريف+اسم+لاحق_اس م	ال_التعريف+اسم+لاحق_اس م	ال_التعريف+اسم+لاحق_اس م	CC+V+PRON	POS
NOUN+NOUN_Suff	NOUN NOUN+NOUN_Suff	NOUN+NOUN_Suff	V	Stem POS
fEAl+p	fEAl	fAEI	fEl	Stem template
Al+	-	Al+	W+	Prefixes
DET	-	DET	CC	Prefixes POS
-	-	-	+t	Suffixes
-	-	-	PRON	Suffixes POS
S, F	S, M	S, F	-	Gender & Number
A, Al, Ald	K, Kl, KlA	A, Al, Alb	w, wr, wrS	Leading characters
p, sp, Asp	L, Al, lAl	p, vp, Hvp	t, dt, Sdt	Trailing characters
no	no	no	no	NE/Sukon word

Case Endings: RNNs

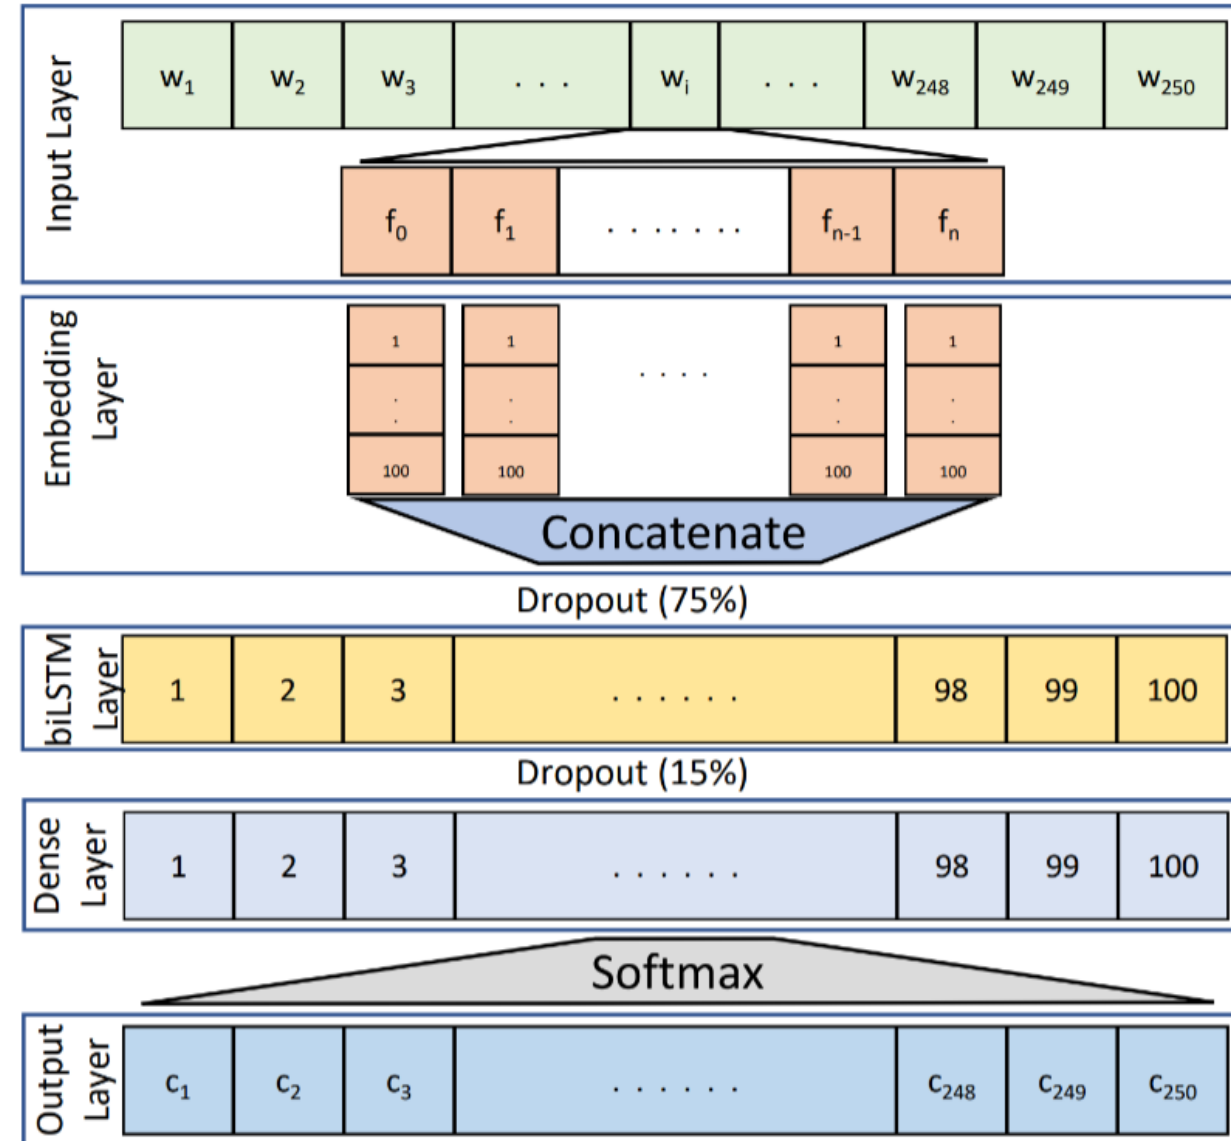

Case Endings: RNNs

RNNs can examine all possible combinations of features

RNNs are not tied to “human” logic, so it can examine features we never thought about

RNNs determine all case endings at the same time

Case Ending: RNN Results

Setup	CEER%
MSA	
word (baseline)	9.1
word-surface	5.7
word-POS	7.0
word-morph	7.6
word-surface-POS-morph	5.2
all-misc	3.7
Microsoft ATKS	9.5
Farasa	10.4
RDI [39]	14.0
MIT [9]	15.3
MADAMIRA [38]	15.9

Case Endings: Character Seq2Seq

Use OpenNMT-tf

Case Endings: Character Seq2Seq

Example: تمكن علماء بريطانيون من الوصول إلى بعد جديد في معرفة...

ت م ك ن - ع ل م ا ء - ب ر ي ط ا ن ي و ن - م ن ...

ت م ك ن - ع ل م ا ء - ب ر ي ط ا ن ي و ن - م ن ...

Words are represented as characters

No need for feature engineering

WER = 48.3% ☹

Case Endings: Character Seq2Seq

Example: تمكن علماء بريطانيون من الوصول إلى بعد جديد في معرفة...

Classical ML vs. RNNs vs. Seq2Seq

We employ RNNs in production, because:

RNNs are much faster than seq2seq

Seq2seq tend to hallucinate

Accuracy of seq2seq > RNNs >>>> classical ML

Thank you – Questions?
